

Patchwork

NOTES ON UML DIAGRAM:

I chose to represent Block's relationship with Patch as an aggregation because patches do not exist outside of their block in Patchwork. However, blocks can exist outside of a quilt (in the block chooser scroll pane, for example), so the relationship between Quilt and Block is not an aggregation.

Dependency arrows were not included (as per instructions) . Some of the more important dependencies would have connected:

- BlockMap to Block and to BlockChooserPane
- Reader to BlockMap and to QuiltApp
- GsonConfigured to Reader and to Quilt
- Writer to QuiltApp
- ConfirmationBox to QuiltApp
- BlockImage to BlockSpacePane and BlockChooserPane
